

VOICE AI FOR EVERYONE

Voiceitt is a speech recognition technology for people with speech disabilities.

Created in collaboration with potential users and speech language pathologists, the Voiceitt app helps people with non-standard speech create standardized audio and text outputs for both in-person communication and remote video/phone conversations. Through unique voice API integrations, Voiceitt enables people with speech disabilities to access and interact with other products and services independently, by voice.

Whether they are in rehab, in the clinic, or simply managing their activities of daily living (ADL's), Voiceitt aims to increase independence, connection and communication for people with disabilities.

"Voiceitt dramatically improves patient and caregiver communications for better outcomes with less frustration." - Dr. Rachel Levy, SLPD, CCC-SLP, Head of Customer Success at Voiceitt

CONNECTION, COMMUNICATION & INDEPENDENCE

At home, at work, and in healthcare settings, there is less need to ask patients, coworkers, family members to repeat themselves or guess what they need:

- Increased opportunities at work through improved communication
- Decreased frustration for patients and their medical teams.
- More productive therapy time and fewer setbacks due to miscommunications.
- Higher patient outcome scores and decreased the time spent during each treatment session (higher reimbursements and improved patient scores).
- Voiceitt is less expensive, with greater adoption rates than other assistive devices.
- Clinicians save time and patients are able to be more involved in their own recovery.
- For rural healthcare, Voiceitt makes telehealth accessible to impacted patients.

UK IMPACT AND EXPANSION – 2024, AND BEYOND

Voiceitt’s UK-based partners have been critical for the growth and ongoing impact of the company since its early development stages, and our UK expansion is pivotal as we transition to commercialization and sales growth.

Voiceitt is excited to announce a new reseller partnership with **Adapt-IT**. Launching to the UK market in late January 2024, together we will bring revolutionary voice to text and audio capabilities to people with non-standard speech in the UK - and to English speakers across Europe and worldwide.

Other partners, customers, resellers, and investors include:

- **Karten Network** - a network of 90 organisations across the UK, involved in research and beta testing through 2 European Commission grants.
- **Ace Centre** - charity providing assessment, training and information services across England, involved in research and data collection with Voiceitt through the EIT Health Bridgehead grant.
- **XTX Ventures** - UK based early-stage VC fund investing solely in companies with machine learning as a core technology, major strategic investor in Voiceitt.
- **UK Policy Connect** - Voiceitt was invited by UK Policy Connect to present to the **House of Lords**, a unique opportunity which coincided perfectly with its geo-expansion via UK resellers.

WE LOOK FORWARD TO EXPANDING VOICEITT’S IMPACT IN THE UK, AND BEYOND.

Below are several video clips, highlighting the diversity of our community, and new use cases, integrations and impact, including a quantum physicist and TED speaker with cerebral palsy, a young child with special needs and a passion for pro hockey; and a college professor with multiple sclerosis and immense curiosity for ancient cultures and artifacts...
